Example 1 - Average income and healthy life expectancy in Birmingham

In this visualisation I used income data from ONS and health data from OHID, processed using Python and rendered using Blender. The data shows us that wealthier areas tend to be healthier.

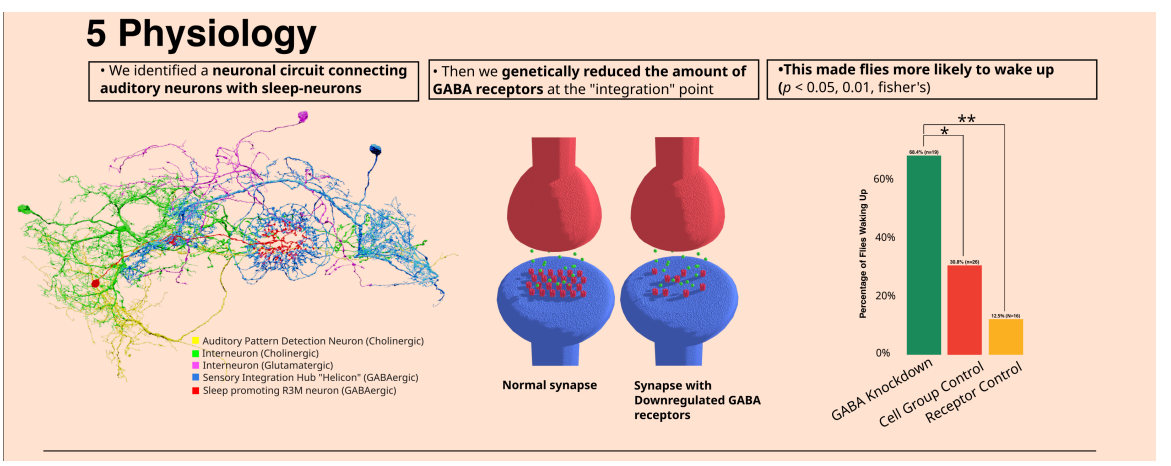

Example 2 - Summary visualisation published in a review article in the scientific journal *Neuroimage*

ACC: anterior cingulate cortex; AMG: Amgydala; DLPFC: dorsolateral prefrontal cortex; IFG: inferior frontal gyrus; MPFC: medial prefrontal gyrus; OFC: orbitofrontal cortex; STS: superior temporal Sulcus.

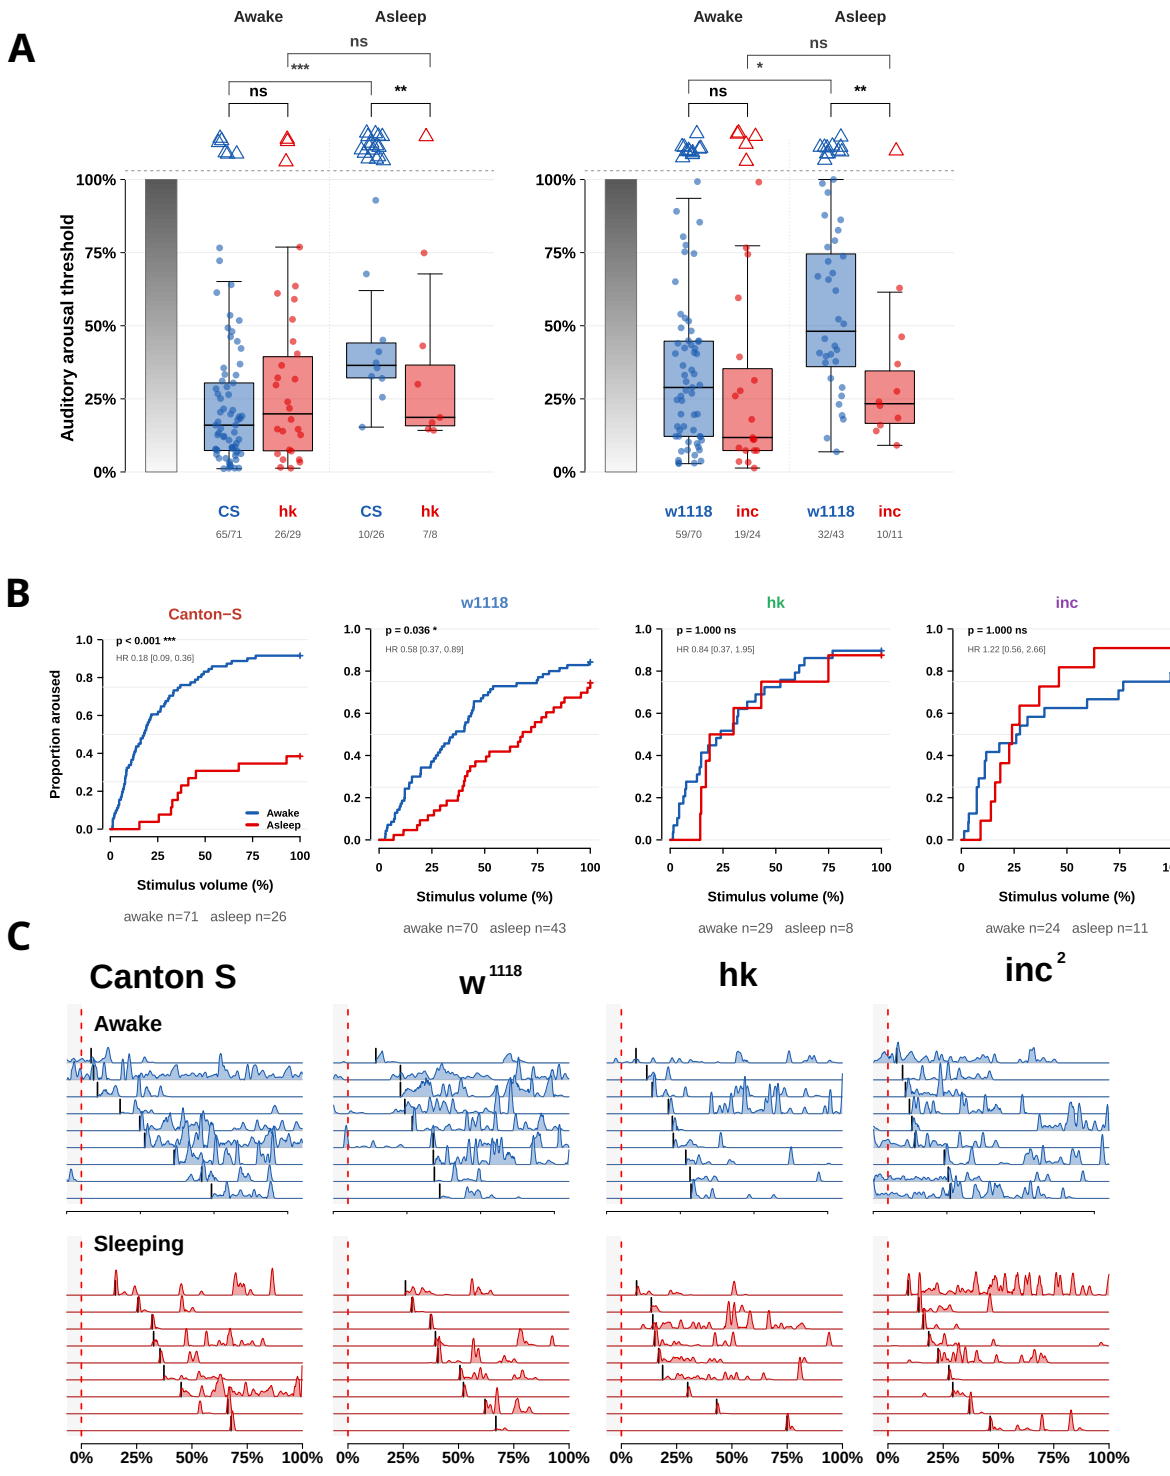

In this visualisation I used anatomical data from a data repository of human brain structures imported into the 3D rendering software Blender. I then carried out a systematic review of papers about emotional regulation, and visualised summary findings.

Example 3 - Excerpt from scientific poster presented at the 2025 conference of the International Society of Physiologists

In this visualisation I used anatomical data from a data repository of neuronal circuits in the brain of *Drosophila* and modelled cells in Blender. Percentage plot and analysis carried out in R.

Example 4 - Visualisation of survival curves and Cox regression. To be published in the scientific journal *SLEEP*

In this visualisation I show the amplitude of sound required to get a reaction from awake or sleeping drosophila with different genes inserted into their genome. A shows the result of a cox hazard regression analysis. B shows Kaplan-Meier survival curves, with amplitude as time to event and the event as whether the organism woke up or not. C shows locomotor activity across states and genotypes.
